EU AI Act Article 11 Technical Documentation

Agent: ResumeRanker (Acme Corp)

Generated: 2026-05-17 13:35 UTC

Prepared in accordance with Regulation (EU) 2024/1689 ('EU AI Act'), Article 11 and Annex IV. This document is for informational purposes only and does not constitute legal advice.

Table of Contents

1. 1. General description of the AI system
2. 2. Detailed description of the elements and the development process
3. 3. Information on monitoring, functioning, and control
4. 4. Risk management system (Article 9)
5. 5. Changes made to the system through its lifecycle
6. 6. Performance metrics including foreseeable misuse
7. 7. Harmonised standards and common specifications applied
8. 8. EU declaration of conformity
9. 9. Post-market monitoring plan (Article 72)
10. Fundamental Rights Impact Assessment (FRIA)
11. Datasheet (Appendix)

1. General description of the AI system

ResumeRanker is an enterprise hiring agent that ranks inbound resumes for shortlisting by recruiters in the HR domain. The provider is the deploying company; the system version evaluated here is v0.1. ResumeRanker ingests resume PDFs and a job description and returns a numerical fit score plus a shortlist recommendation, in accordance with Article 11 and Annex IV.

Categories of natural persons affected are job applicants for advertised roles. The system is intended to be used by trained HR staff and operates as a decision-support tool, not as a fully automated hiring decision, consistent with Article 14 human oversight obligations.

2. Detailed description of the elements and the development process

ResumeRanker is built on top of a general-purpose large language model wrapped by a retrieval pipeline that compares structured resume features against the job description. Training data for the underlying LLM is managed by its provider; ResumeRanker itself is not fine-tuned on candidate data, in line with Article 10 data governance.

Validation procedures include subgroup performance evaluation across protected categories, with documented test sets and acceptance thresholds. Human oversight controls are implemented as recruiter approval gates before any candidate communication is dispatched.

3. Information on monitoring, functioning, and control

Operational monitoring captures decision distributions per role and per applicant cohort, reviewed weekly by HR analytics. Recruiters retain the ability to override scores, and any score below a confidence threshold is routed for manual review under Article 14.

Known operational limits: the system is intended for English-language resumes within knowledge-worker roles. Use outside this scope is not validated and triggers a substantial-modification review under Article 6.

4. Risk management system (Article 9)

A risk management system has been established in accordance with Article 9. Identified risks include disparate impact on protected groups, over-reliance by recruiters, and propagation of historical bias from job descriptions.

Risks are estimated through pre-deployment testing and continuous production monitoring. Mitigation measures include feature ablation tests, calibration of decision thresholds per cohort, and documented escalation paths for incidents.

5. Changes made to the system through its lifecycle

Changes to the system are tracked in a versioned changelog with sign-off from the provider's compliance officer. Substantial modifications—new input modalities, new candidate populations, or material changes to the scoring logic—trigger re-classification under Article 6 and a refreshed Article 11 technical file.

Minor parameter adjustments are tracked but do not require re-classification.

6. Performance metrics including foreseeable misuse

Performance is measured via top-k recall against historical recruiter shortlists, with subgroup parity metrics computed across protected characteristics in accordance with Article 15. Cybersecurity testing covers prompt injection and resume-content exfiltration attempts.

Foreseeable misuse includes recruiters treating the score as a final decision; this is mitigated by Article 14 oversight controls and in-product warnings.

7. Harmonised standards and common specifications applied

ISO/IEC 42001 (AI management system) and ISO/IEC 23894 (AI risk management) are applied as governing frameworks. ISO/IEC 25059 quality characteristics inform the performance specification. Where harmonised standards do not yet exist, alternative technical solutions are documented with rationale, in accordance with Article 40.

8. EU declaration of conformity

An EU declaration of conformity is drawn up in accordance with Article 47 and made available to national authorities on request. The declaration states that ResumeRanker meets the relevant requirements of Chapter III, Section 2 of the EU AI Act and identifies the provider, the system, and the conformity assessment route taken.

9. Post-market monitoring plan (Article 72)

A post-market monitoring system is operated under Article 72. Logged data from production is sampled monthly to recompute subgroup parity, reviewer override rate, and serious-incident indicators. Serious incidents are reported to the relevant market-surveillance authority under Article 73, with corrective actions tracked to closure.

Fundamental Rights Impact Assessment (FRIA)

1. Description of the deployer's processes — ResumeRanker is used by HR recruiters during the screening stage of open requisitions. Each requisition is reviewed by a named recruiter who validates the shortlist before any candidate is contacted, in accordance with Article 27.
2. Period and frequency of intended use — The system runs on every inbound application for participating roles, typically tens to hundreds of applications per requisition over a four-week posting window.
3. Categories of natural persons and groups likely to be affected — Job applicants are the primary affected group. Particular attention is paid to applicants in protected categories under EU non-discrimination law.
4. Specific risks of harm to fundamental rights — Risks include unfair exclusion through proxy features, opacity of decision rationale, and amplification of historical hiring biases. These are addressed through Article 10 data governance and Article 9 risk management measures.
5. Human oversight measures — Article 14 oversight is implemented as a recruiter approval gate, mandatory review of low-confidence scores, and logging of all overrides for audit.
6. Measures to be taken if risks materialise — Internal governance escalates incidents to the data protection officer and triggers a corrective action plan, with reporting to the relevant market-surveillance authority where required under Article 73.

Datasheet — Appendix

Field	Value
Model Provider	Acme Corp / Gemini 2.0 Flash backbone
Intended Use	Rank inbound resumes for shortlisting by HR recruiters in knowledge-worker roles.
Training Data Summary	No fine-tuning on candidate data. Underlying LLM training data is managed by the model provider; resume features are processed in memory only, in accordance with Article 10 data governance.
Performance Metrics	Top-k recall against historical recruiter shortlists, subgroup parity across protected characteristics, prompt-injection robustness rate; tracked under Article 72 post-market monitoring.
Known Limitations	English-language resumes only; not validated outside knowledge-worker roles. Use outside this scope triggers re-classification under Article 6.
Human Oversight	Article 14 measures: recruiter approval gate before candidate contact; mandatory review of low-confidence scores; full audit log of overrides.
